Vologda Oblast," S. V. Sorokin, All-Union Inst for
Plant Protection, All-Union Acad Agr Sci imeni
Lenin, 18 pp

"Zool Zhur" Vol XXVIII, No 4

Soil beneath the granary is ideal nidus for survival
and multiplication of various food mites, including
common parasites, flour mite and Gl. destructor.
Reducing average moisture of a given substratum to
to 14% inhibits development of the flour mite, but
does not affect the Gl. destructor.

TITLE: Deep extrusion of parts made of titanium and its alloys

PERIODICAL: Kuznechno-shtampovochnoye proizvodstvo, no. 3, 1962, 14-17

TEXT: The article contains brief general information on the physical and mechanical properties of Ti and Ti alloys, and technical recommendations for the deep extrusion of ~~BT~~1-1 (VT1-1) and ~~OT~~-4 (OT-4) alloys. These two alloys and ~~BT~~1-2 (VT1-2) are used for containers, streamlined casings, platings, and shaped elements. Recommendations are given after studying the behavior of VT1-1 and OT-4 alloys in extrusion at 20-650°C. It is stated that the extrusion factor (K), can be raised mainly by reducing the deformation resistance of the flange of the stampings and by increasing the wall strength in the critical spot, which can be achieved by heating the flange and cooling the walls and the bottom of the stampings. The experimental die design providing these conditions is shown (Fig. 1). The maximum extrusion

Card 1/1

Deep extrusion ...

S/182/62/000/003/003/006
D040/D113

factor reached in cold extrusion of VT1-1 and OT-4 alloys was 1.8±2.0 and 1.4±1.5, respectively. K=2.6 was reached in extruding OT-4 at 300-450°C. The article includes tables of the mechanical properties of the alloys and their variations with temperature, and graphs showing the wall thickness at different extrusion factors, the dependence of K on temperature, and the hardening of the walls of stampings at different K values. Annealing is obligatory to remove residual stresses. The annealing schedule for the VT1-1 alloy after the last stamping operation is: (a) Heating to 500-550°C; (b) up to 1.0 mm thick metal soaked at this temperature for 10-12 min, 1.0-3.0 mm thick metal for 15-20 min, 3.0-4.0 mm thick metal for 35-45 min; cooling in air. Intermediate annealing for removing the hardening: Heating to 530-600°C, soaking at this temperature for 10-12 min per 1 mm billet thickness. For OT-4 the intermediate annealing temperature is 600-650°C, and the soaking time 10-15 min per 1 mm thickness; ready stampings must be annealed at 550-650°C to remove residual stresses, soaking time is 10-30 min, depending on thickness. In cold stamping, the annealing temperature must be nearer to the upper limit, and in hot stamping it must be nearer to the lower limit. Lower annealing temperature and shorter soaking time will not

TITLE: Electrolytic refining of titanium-aluminium alloys

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye tekhnicheskikh nauk. Metallurgiya i toplivo, no.6, 1961, 30-36

TEXT: The present investigation was carried out on laboratory apparatus suitable for preparing up to 100g of cathodic metal. Electrolysis was carried out in a stainless steel crucible, using an electrolyte of an equimolecular mixture of sodium and potassium chlorides with additions of the lower chlorides of titanium. The anode material was an alloy containing 65% Ti and 30% Al, obtained from the thermal reduction of titanium-containing sources by aluminium. The alloy was ground and placed in an anode basket of perforated sheet nickel with 2 mm perforations. The cathodes were steel rods. The aim of the investigation was to determine the optimum conditions for producing a cathode precipitate with a minimum content of

Card 1/ 3

Electrolytic refining of ...

S/180/61/000/006/003/020
E021/E135

aluminium whilst at the same time obtaining a satisfactory current efficiency and as complete a utilisation of the anode material as possible. The effect of the cathodic current density was first studied with a temperature of 800 ± 10 °C, an anodic material of 10 mm diameter particles, an anodic current density of $0.02-0.08$ A/cm² and a titanium content in the electrolyte of 2.5-3%. The optimum cathodic current density was 5 A/cm². At this current density there was a minimum aluminium content in the cathode precipitate and also maximum efficiency. The effect of temperature (700-900 °C) was studied using a cathodic current density of 5 A/cm². The results showed that the optimum temperature was 700 °C. However, since there were difficulties in carrying out electrolysis at this temperature (e.g. low fluidity of electrolyte), 750 °C was recommended. A significant decrease in current efficiency and increase in aluminium content in the precipitate only occurred above 800 °C. The concentration of titanium in the electrolyte (in the form of its lower chlorides) was also studied in the range 2-14%. This was found to be the decisive factor in controlling the cathode precipitate.

Increasing the output of a Martin furnace by means of preliminary continuous refining of the molten pig iron with an air blast. V. A. Sosukin. *Udal. Met.* 1937, No. 1, 18-20; *Chem. Zentr.* 1938, I, 3882. The capacity of a Martin furnace can be essentially increased by refining the crude iron in the iron discharge trough by the use of an air blast (cold air, warm air, or O₂-enriched air) prior to its entrance to the Martin furnace. The process can be used in those plants which operate with molten iron. The economic aspects of the method under conditions prevailing in Russia are discussed. M. G. Moore

Activated agglomerate of magnetic iron ore. V. A. Sorokin, M. Kh. Lukashenko, I. F. Grigorovich, and P. V. Muzalov. Sbornik Nauch. Trudov Mez. Fak. Donsk. Inst. 1953, No. 4, 85-129; Referat. Zhur., MZh. 1953, Abstr. No. 0717.—By applying a fine spray of water to a layer of Fe ore during agglomeration H is formed by interaction of C and H₂O, and reduces a considerable part of the Fe₂O₃ to FeO, producing a more porous agglomerate with greater surface area. The consumption of water varies from 17.3% of the charge for 5% of coke fines to 27-30% for 18% of coke fines. For S-contg. iron ore, with an input of 5-20% of coke fines the consumption of C varies from 2 to 14.6%, depending on the vacuum, the degree of reduction of the iron oxides, and the rate of spraying. The formation of up to 40-60% of ferrous silicate in activated agglomerate contg. baked-in C is compatible with high chem. activity and mechanical strength. Use of the water spray increased the capacity of the sintering plant by 55-65%. Use of the activated agglomerate in the blast furnace increased the capacity by 13% and decreased coke consumption by 1.8%.

TITLE: Efficiency Improvement in Feeding Raw Materials to a Blast
Furnace (Ratsionalizatsiya usloviy podachi syrykh
materialov v domennuyu pech')
PERIODICAL: Stal', 1959, Nr 1, p 15 (USSR)
ABSTRACT: A scheme of supplying blast-furnace feed to skips based
on diploma work of the Donets Institute students is
briefly outlined. The main feature is the replacement of
the scale car by conveyors. The weighing is carried out
on a stationary balance and weighing funnels. When
operating with hot sinter, its bunkers should be situated
over the skip hoist. Sinter is screened in a manner
similar to that used for screening coke (figure).
There is 1 figure.

TITLE: First Results of the Experimental Operation of a System of Devices
for the Automatic Control of Heat Conditions in a Blast Furnace

PERIODICAL: Tr. Donetsk. industr. in-ta, 1959, Vol. 40, pp. 19 - 32

TEXT: In accordance with formulae of heat control submitted, the calculation of basic parameters of blast furnace smelting process depends on 39 variables, some of which are varying slowly with time and the rest are varying continuously. The calculation of blast furnace melting parameters by these formulae, is carried out with the use of computing devices designed by the L'vov Polytechnic Institute. The parameters varying slowly with time, are supplied to the computer with the aid of a manual apparatus handle; the continuously varying parameters are introduced automatically. To obtain continuously the values of these parameters, measuring devices are mounted which are equipped with additional indicators for the trans-

Tests on Elliptical Tuyeres. V. A. Sorokin et al. (Stal', 1965, (2), 107-113). (In Russian.) An account of previous experiments in the use of tuyeres of elliptical section, recent full-scale tests on an 18-ft hearth diameter blast furnace at the Stalin works are described. Details of the furnace operation with normal and elliptical tuyeres are given, and evidence is presented of increase in the active zone of the hearth with the latter. Best effects were obtained when ores were charged preferentially to the walls. With elliptical tuyeres the pressure-drop up the furnace decreased, enabling higher blowing rates and blast temperatures to be used, the productivity increasing by 3.03%, and coke rate decreasing by 2.84%. The lives of the two types of tuyeres were equal.

TITLE: A New Welding Fixture (Novoye svarochnoye prispobleniye)

PERIODICAL: Mashinostroitel', 1956, Nr 2-3, p 32

ABSTRACT: A description is presented of the design of a fixture for high-output resistance seam welding to tubular frames of tubes (T) of > 18 mm diam, with walls of 0.1-0.5 mm thickness. The fixture is mounted on to MShP type welders with ignitron interrupters. Use of this fixture speeds the welding of tubes and improves the quality of the welded seam.

TITLE: A Saving of More than 100,000 Rubles per Year (Boleye stasyach rubley ekonomii v god)

PERIODICAL: Mashinostroitel', 1958, Nr 11, pp 13 - 14 (USSR)

ABSTRACT: In the Moskovskiy eksperimental'nyy zavod NIIKhIMMASH (Moscow Experimental Plant NIIKhIMMASH) the serial production of the super-high pressure hydraulic compressor GK-7/6,000 started seven years ago. The compressor was developed by Professor L.F. Vereshchagin and Engineer V.Ye. Ivanov in the Laboratoriya fiziki sverkhvysokikh davleniy Akademii nauk SSSR (Laboratory of Super-High Pressures of the USSR Academy of Sciences). In 1956, the compressor was modernized by installing a container of operating liquid with a capacity of 12 liters, two plunger pumps ensuring a pressure of 50-60 kg/cm² for lubrication and by reducing the size of the metal frame. These improvements permitted an increase in the operation pressure to 8,000 atm. For a further increase to 10,000 atm, the slide (Figures 2 and 3) were made of steel instead of rub-

TITLE: A Device for Grinding Gear Shaper Tools

PERIODICAL: Mashinostroitel', 1959, Nr 5, p 39 (USSR)

ABSTRACT: The device, developed by operator M.G. Larkin with the assistance of Designer A.A. Karpukhin, is designed for application in shops where no special tool grinding machines are available. It consists of a cast iron base plate, with an electric motor (of 0.6 kw at 1400 rpm) on it, and an emery wheel mounted directly on the motor shaft. The motor moves on guides. The tool to be sharpened is held in a holder fixed on the base plate. The device permits the sharpening of gear shaper cutters with the needed accuracy without preparation by template. It has reduced by 10 times the grinding time. There are 2 photos and 1 diagram.

TITLE: Burner for welding vinyl plastics

PERIODICAL: Khimicheskoye mashinostroyeniye, no. 6, 1961, 43

TEXT: The author describes a burner (Fig.I) to be used for welding vinyl plastics, organic glass and other plastic materials, developed by P.V. Bandurin, mechanic and innovator of the NIIKhIMMASH. The nozzle of the welding burner must be held at a distance of 15-20 mm from the point of welding. The included angle of the weld must be 60° for a material 1-5 mm thick, and 70° for sheets thicker than 5 mm. The burner reaches a capacity of 15-20 m/hour when welding 4 mm thick vinyl plastics with a V-weld. The weld has a strength of 70-90% of the strength of the welded material. There is 1 figure.

TITLE: Lectures by a Chinese Scientist (Lektsii kitayskogo uchenogo).
In the Institute for Sinology (V institute kitayevedeniya)

PERIODICAL: Vestnik Akademii Nauk SSSR, 1958, Nr 2, pp. 106-106
(USSR)

ABSTRACT: In November 1957 the distinguished Chinese scientist Chzhen Chzhen'-Do followed an invitation of the AS USSR and visited the Soviet Union. He is the Director of the Institutes for Literature and Archeology of the Academy of Sciences of the CPR (Chinese People's Republic) and Deputy Minister for Culture. In the Institute for Sinology he gave a series of lectures on the history of Chinese artistic prose. He is known as an important expert in the field of the history of Chinese literature and culture. He is the author of a great number of publications and articles on the history of Chinese prose, dramaturgy, poetry and popular art, painting and engravings, archeology and epigraphy. In his lectures he treated the development of the Chinese artistic prose from its origin to the beginning of the 20th century. He stressed the influence of Indian, especially Buddhist literature. Besides

Card 1/2

Lectures by a Chinese Scientist. In the Institute for Sinology 30-2-37/49

the analysis of classical novels he gave a characterization of stories and novelettes which had not been investigated before. Finally he characterized the accusing novels of the last period of the Tsin dynasty, which he called a mirror image of the Chinese regime of that time - half colonial, half feudal. In the Leningrade branch of the Institute for Orientalistics he gave a lecture on the periodization in the history of Chinese literature. During his stay in the USSR Chzhen Chzhen'-Do got to know the collections of sinological books in some Moscow and Leningrade libraries as well as collections of Chinese art. In Georgia and Armenia he studied the results of archeological investigations.

TITLE: Welding aluminum alloys with consumable electrode in an argon-chlorine mixture

PERIODICAL: Svarochnoye proizvodstvo, no. 12, 1962, 16 - 19

TEXT: Information is given on the possibility of welding some aluminum alloys without previous refining of the part and the wire, by using an argon-chlorine mixture. The chlorine is prepared in an electrolytic cell and the argon-chlorine mixture is obtained in a tee-type glass mixer with a capillary in the horizontal section. Passing through the capillary, the argon flux ejects the chlorine which is supplied to the mixer through an inclined tube. The argon consumption passing through the mixer is 12 - 16 l/hour. The effect of chlorine on the reduction of porosity in welds was tested on chemically refined and unrefined AMr 6 (AMg6) and B 92 (V92) alloy plates, 10 and 20 mm thick. The plates were welded with contaminated AMg6 wire 2 mm in diameter, in an argon-chlorine mixture; chlorine consumption was from 1 to 20 cm³/min. It was found that unrefined sheets, welded with unrefined wire, showed high porosity of the welded

Card 1/2

Welding aluminum alloys with...

S/135/62/000/012/006/015
A006/A101

Joints. Small admixtures of chlorine to the arc gap, supplied through a contact tube of the welding torch during welding in argon, produced welded joints without pores, as established by X-ray control. Optimum chlorine consumption in welding 10 - 20 mm thick AMg6 alloy is 10 - 12 cm³/min. On the basis of the results obtained an industrial unit was developed, intended for the arc welding with consumable electrode of aluminum alloy in argon and chlorine. Its design is simple, and it can operate during 100 hours without being recharged; safety conditions are satisfactory, if conventional ventilation is assured. The method developed can be recommended to be brought into use, as it assures savings of means required for the refining of the parts and the wire. There are 6 figures and 1 table.

- AUTHOR: Sorokin, V. I.
- TITLE: An Experiment in Applying Electric Locomotive Transportation in Coal Pits (Opyt primeneniya elektrovoznogo transporta na ugol'nykh razrezakh)
- PERIODICAL: Sbornik: Sovershenstvovaniye otkrytoy razrabotki mesto-rozhdeniy poleznykh iskopayemykh Moscow, Ugletekhizdat, 1955, pp. 295-316
- ABSTRACT: Electric traction (basically with 1650-v d-c current) at present rapidly is displacing steam traction in hauling debris; at the same time the productivity of electric traction rolling stock increases; for example, the productivity of the Korkinugol' trust during the past 5 years increased by 74 per cent. The efficiency of electric traction can be explained by: a) reduced volume of fundamental mining work for the arrangement of down grades due to the possibility of increasing grades up to 40 per mille and of applying small

Card 1/3

112-1-919

An Experiment in Applying Electric Locomotive Transportation in Coal Pits (Cont.)

radius curves of 80 to 100 m; b) reduced fire hazard; c) reduction of cost of haulage as compared with steam traction by 25 to 37.5 per cent, and others. The unit power consumption depends on the season. In the Vakhrushev-ugol' trust the unit power consumption for the year 1954 amounted to 2.84-3.39 kwhr during the winter months and 1.84 to 2.05 kwhr per 1 cu m of removal during the summer. Traction substations do not differ from regular d-c substations. The system of contact wire suspension is the simple compensated one. In cut places and dump routes a simple rigid suspension system is used, while in the cutting routes the contact wire is suspended on the side of the track at a distance of 2.2 to 2.5 m. The new supporting structures for the contact wire are distinguished by the base which is in the form of two long tie-beams fastened to the track rails and rigidly connected with it by two sections of a Nr 14 - 16 channel beam. In this way the supports along with sectors of the track are moved by a crane during the moving of the track. Basic data on the electric locomotives used in coal mining and a powerful electric locomotive planned are presented. A system of

Card 2/3

112-1-919

An Experiment in Applying Electric Locomotive Transportation in Coal Pits (Cont!)

repairing the rolling stock is described. Great perspectives of the further development of electric traction in coal pits are indicated and the necessity of introducing signalization, centralization and blocking systems (STsB) and of studying the problem of using a single-phase current of normal frequency for traction are pointed out.
